TECHNICAL DATA

This survey was carried out on an objective group of people aged 18 and above, all resident in Catalonia. A total of 1.200 interviews were carried out. The margin of error associated with the survey as a whole is $\pm 2,9\%$, with a reliability level of 95%, with $p = q = 0.5$.

The sample was constructed following a random design, structured in two stages within each constituency. Firstly, interviews were distributed on the basis of the distribution of the local populace, with groups of towns arranged according to size. The selection of the towns within each group was made at random. Subsequently, addresses were chosen at random and the individuals interviewed were chosen on the basis of their sex and age, reflecting the actual proportions found within the town in question. Field work was carried out from 26 September to 13 October 1994 by the company Central de Campo s.a., and ICB s.a.

CONTENTS
