In recent years, technological advances have made it possible to develop devices that can be used by health professionals not specialized in clinical laboratory, or even by the patients themselves, to obtain measured values of clinical tests. The number and catalogue of tests that can be performed outside of the clinical laboratory and near the patient is increasing rapidly.

ACCLC and SCB have decided to dedicate the present edition of the European Symposium discussing topics around the analysis near the patient, with the purpose of creating a discussion forum to share experiences between the various professionals involved and promoting the quality and safety of patients care.

The symposium will be held in the form of an open discussion between experts and with the active participation of the audience. It is structured in four sessions in which it will be discussed experiences in rapid diagnostic units from the point of view of users, the role of clinical laboratory professionals in coordinating point of care tests and the implementation of strategies and tools to ensure quality and accreditation of these tests. Finally, with the help of the in vitro diagnostics industry and universities, the latest technological developments in this field and future trends will be presented.
